To whom it may concern.

Re: Pavithran a/l Ravi (SD00017691))

This is 2: 6 years old boy was referred from Klinik Kesihatan Kajang to us for speech delayed. He was seen by doctor on 26th of Jun 2006 and referred to Audiologist for hearing assessment. According to the parents this boy has no speech at all and always pointing to anything he wants. He has no history of hearing assessment done before.

2. Hearing assessment done and result showed :

- i. 28th of June 2006
Distraction test done and result showed : No response at all intensity tested
- ii. 19th of December 2006
Brainstem Evoked Response done and result showed : No response at 100dBnHL bilaterally which suggest profound hearing loss bilaterally
Tympanometry showed type A bilaterally revealed normal middle ear function bilaterally
- iii. 06th of February 2007 (Hearing assessment repeated as requested by the parents)
Brainstem Evoked Response done and result showed : No response at 100dBnHL bilaterally which suggest profound hearing loss bilaterally same as previous result.
Tympanometry showed type A bilaterally revealed normal middle ear function bilaterally

3. This boy is strongly suggested to buy and wear a pair of hearing aid as soon as possible to overcome the problems. After he was fitted he still need to come for further management and also referred to speech therapist for his speech delayed.

4. Here, I enclosed the result for your reference.

Kindly do the needful. Thanks you.
